

**What should be the answer for
Wadden Sea policy?**

A dual strategy for dealing with the challenges of climate change in the Wadden Sea:

1. Climate protection: a particular responsibility to fight against climate change
2. Adaptation: start to prepare ourselves to adapt to those changes which will unavoidably come

Climate protection: a particular responsibility to fight against climate change

- We should go for a 100 % renewable energy production till 2030
 - Renewables
 - No new coal energy plants in the region
 - No new oil drilling activities

Adaptation: start to prepare ourselves to adapt to those changes which will unavoidably come

- Set up many pilot projects
- Go for unusual cooperations
- Develop a new goal for coastal defence in the Wadden Sea

„Protect the people against storm tides and protect the Wadden Sea and the coast as a whole in its natural functions“
